## U. S. DEPARTMENT OF AGRICULTURE, FOREST SERVICE—Circular 213.

HENRY S. GRAVES, Forester.

FOREST PRODUCTS LABORATORY SERIES.

# MECHANICAL PROPERTIES OF WOODS GROWN IN THE UNITED STATES.

PRELIMINARY SUMMARY OF TESTS ON SMALL, CLEAR, GREEN SPECIMENS OF FORTY-NINE SPECIES OF WOOD.

WASHINGTON
GOVERNMENT PRINTING OFFICE
1913

### FOREST SERVICE.

HENRY S. GRAVES, Forester. ALBERT F. POTTER, Associate Forester. HERBERT A. SMITH, Editor.

#### BRANCH OF PRODUCTS.

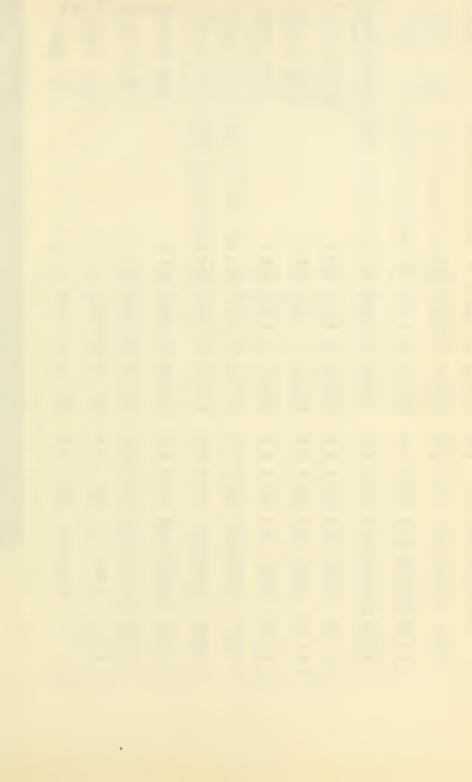

W. B. Greeley, Assistant Forester, in Charge. Howard F. Weiss, Director, Forest Products Laboratory.

### TIMBER TESTS.

John A. Newlin, Engineer in Forest Products, in Charge Timber Tests, Forest Products Laboratory. Thomas R. C. Wilson, Assistant Engineer in Forest Products.

O. P. M. Goss, Engineer in Forest Products, in Charge Seattle (Wash.) Testing Laboratory.

Norman de W. Betts, Engineer in Forest Products, in Charge Boulder (Colo.) Testing Laboratory.

### Table 1.—Results of tests on 49 species of wood tested in a green condition in the form of small clear pieces.

[Test specimens are 2 by 2 inches in section. Bending specimens are cut 30 inches long; others are shorter, depending on kind of test.]

Species: Common name and botanical name.	Locality where grown.	Num-	Ringe	Propor-	- Mois-	Specific ity, ove based	en dry,	to oven dry condition		reen tion.	Static bending.				Impact bending. NOTE.—The blank spaces in the table are due to th

# MECHANICAL PROPERTIES OF WOODS GROWN IN THE UNITED STATES.

### THE TESTS.

The tests made by the Forest Service to determine the mechanical properties of woods grown in the United States fall into two classes: (1) Tests on full-sized pieces, such as bridge stringers and car sills, and (2) tests on small clear pieces free from defects. Tests of the first kind have been made on a number of species and the results presented in several publications. (See list on p. 4.) These results are of value in the formulation of grading rules for structural timber, in the establishment of working stresses, and in showing the influence of defects such as knots, shakes, and checks upon the strength of the material.

A series of tests of the second kind was begun by the Forest Service about two years ago to secure information that will enable the mechanical properties of the different woods to be compared, both in the green and air-dry state, and to determine the influence on strength of such factors as locality of growth, height of test pieces in the tree, and distance of pieces from pith. This preliminary circular gives in condensed form the average values thus far obtained from 49 species of wood tested in a green condition. More detailed analyses of the values will follow as the work progresses. The test material was cut from typical trees selected by members of the Forest Service, and records were made of the conditions of growth. Eventually each important species will be represented by averages from at least five typical trees from each of several localities throughout its range of growth. In several of the species listed in Table 1 averages are given from tests on less than five trees. Since there is considerable variation in the strength of wood from individual trees of the same species, such results should be taken as indications rather than as fixed values. The number of test pieces from each tree varied from 40 to 120, depending on the size of the tree. The total number of tests represented in Table 1 is about 25,000.

The tests, which comprise the series described above and others made previously, were made at laboratories of the Forest Service maintained in cooperation with the University of Wisconsin, Purdue University, University of Colorado, University of California, and University of Washington.

### THE RESULTS.

Table 1 gives average values obtained from tests on green material 2 by 2 inches in cross section. The following kinds of tests were made: Bending, both static and impact; compression parallel and compression perpendicular to the grain; hardness; shear parallel to grain; cleavage or splitting; and tension at right angles to grain. The table also includes information on shrinkage, specific gravity, moisture content when tested, proportion of summerwood, and rate of growth or rings per radial inch.

### LIST OF FOREST SERVICE PUBLICATIONS ON MECHANICAL AND PHYSICAL PROPERTIES OF WOOD.

#### BULLETINS.

- Bul. 6. Timber Physics, Part I, Preliminary Report.<sup>1</sup>
  - 8. Timber Physics, Part II, Progress Report.1
  - Timber—an Elementary Discussion of the Characteristics and Properties of Wood.<sup>1</sup>
  - 13. Timber Pines of the Southern United States.
  - 58. The Red Gum.
  - 70. Effect of Moisture Upon the Strength and Stiffness of Wood.1
  - 80. The Commercial Hickories.
  - 88. Properties and Uses of Douglas Fir.
  - 108. Tests of Structural Timbers.1
  - 115. Mechanical Properties of Western Hemlock.
  - 122. Mechanical Properties of Western Larch.

#### CIRCULARS.

- Cir. 12. Southern Pine—Mechanical and Physical Properties. 1
  - 15. Summary of Mechanical Tests on Thirty-Two Species of American Woods.<sup>1</sup>
  - 38. Instructions to Engineers of Timber Tests (Revised).
  - 39. Experiments on the Strength of Treated Timber.
  - 108. Strength of Wood as Influenced by Moisture.1
  - 115. Second Progress Report on the Strength of Structural Timber.
  - 142. Tests of Vehicle and Implement Woods,
  - 164. Properties and Uses of Southern Pines.
  - 179. Utilization of California Eucalypts.
  - 189. Strength Values for Structural Timbers.1
  - 193. Mechanical Properties of Redwood.
